

To Whom It May Concern!

It would be a great opportunity to get the internship work from you.

As a student of Seoul National University of Science and Technology, I have a special interest in Programming in addition to my major in Electrical Engineering.

It was delightful for me to make any software with only a computer when I first learned coding in the university as I would like to make things out, which urged me to learn the area of programming in the offered lectures, such as C-language, java, unix programming, Data communication and machine learning.

From my learning, I made small games from CMD and through C-language.

I also tried to perform a small project showing the condition of the express way road based on the driver through java.

In my military service, I chose to work for my career and focused on data structure, algorithm, c# and c++.

After releasing from my duty, I tried to make a game applying the C# and unity tool for fun. I also made a face recognition program in C++ using openCV.

Based upon my experience in using the tools and trying some projects, I feel that algorithm is also important in developing my career.

Currently, I am uploading the algorithm I studied utilizing the various languages such as C#, java, python, C++ on GitHub. (<https://github.com/93hschoi>)

In addition, I am studying spring framework and django framework for the Web Programming which I have a special interest now.

I didn't have a field experience since I am a student, which made a decision to apply for your internship. From the internship, I expect to join the team-work project and to have a chance to get a field experience through you.

I'm graduating in August of this year, and I can start working full-time right away.

Thank you for your time and concern  
and I am waiting for your reply.
